

HYDAC Diesel PreCare HDP 240 BestCost

HDP 240 BC – pre-filter

HDP 240 BC in the system

Description

The new pre-filter HDP 240 BC expands the HYDAC product portfolio in the field of Diesel fuel filtration on compact engines.

While formerly a flow volume from 340 up to 2400 l/h has been covered, this new product complements the range in the lower area to 240 l/h.

Even this compact size does not make any compromises concerning water separation. The separation takes place in two technically separated steps: coalescence and separation stage – same process like in bigger filter sizes.

Requirements of modern fuel injection systems on filtration and separation can perfectly be matched by this technical trick.

Options:

- Adaptable diesel fuel heating
- Water level sensor
- Adaptable priming pump (manual)
 - Operation optionally from left, right or front
- Transparent or black bowl
- Connections:
 - Inlet: from left, right or top
 - Outlet: to left, right or top

Product Advantages

- **Dual function: Diesel filtration and water separation** through the two-stage element design
- **High performance stability**, due to an efficient water separation on clean side over the entire service life.
- **Element change = complete overhaul**, since the water separation stage integrated in the element is also replaced.
- **Extraordinary service friendliness** through simple and fast element change
- **Flexible in use** due to inlet/outlet option
- **Guaranteed HYDAC quality** since the filter can only be operated with use of an original HYDAC element
